

## Wringer Information

### TYPES:

**Down-press wringers** feature an ergonomic design that operates with a downward motion to apply pressure on the mop head. They provide an ergonomic alternative to side-press wringers.

Down  
Press

**Side-press wringers** operate with horizontal motion, requiring additional effort from the user to create compression.

Side  
Press

**Funnel wringers** operate by inserting the mop head directly into the funnel, then gripping the mop handle while pushing it down into the funnel using body weight. Funnel wringers have no moving parts or metal.

Funnel

### MATERIAL:

**Plastic** is easy to transport, lightweight, and resistant to rust and chemicals. **Steel** is highly durable with excellent rust, corrosion, water, and chemical resistance. It's easy to clean and maintain for an extended service life.

## Mop Bucket & Wringer Combinations

- Plastic bucket
- Include casters

The bucket provides a large capacity reservoir for water or floor cleaning solution with a wringer for removing excess liquid. This process prevents dirty water from tracking on clean floors and promotes fast drying times.

2FTP8 features an all-in-one compact design with an integrated bucket and wringer that provides effective wringing and no lost parts.

WaveBrake combos help prevent workplace hazards associated with spills and splashes. Color-coding on bucket/wringer combos can prevent cross-contamination, helping users organize by function or building area. A pour spout and sink ledge make emptying the bucket quick and efficient.

## Mop Buckets

- Include handle

**Mop buckets** hold water and chemicals for cleaning floors. They have handles for easy transport and maneuverability. Wheels and handles provide for easy transport of liquids throughout a facility. They do not include a wringer.

**Dirty water bucket** is designed for use with WaveBrake mop buckets. The bucket sits inside the larger mop bucket to prevent dirty water from contaminating the cleaning solution in the main bucket reservoir.

**Split-compartment mop buckets** feature two equal-capacity reservoirs. One compartment saturates the sponge mop head with a cleaning solution and the other rinse the mop head between mopping passes.
