Window Washing Squeegees & Scrubbers

Window washing squeegees protect windows by washing off deposits, then wiping remaining liquid and debris away. Squeegees come with handles and replaceable straight blades to wipe water away from window surfaces for a streak-free finish immediately after washing. **T-bars** support washer sleeves to provide even scrubbing pressure. They can be handheld or pole-mounted for hard-to-reach areas. A T-Bar must be used with a window washer sleeve, which saturates and scrubs deposits from

window surfaces. The broad contact area washes large surfaces quickly. **Pads and pad holders** work together to create an easy window and glass cleaning system. The pads remove dust, fingerprints, grease, and other light dirt from glass. Pads are used with either a handheld or pole-mounted pad holder. **Kits** provide a complete window washing system. **Brushes** feature medium stiffness polystyrene bristles designed to efficiently scrub dirt and grime from glass windows.

Pure Water Cleaning

Cleaning systems filter tap water through compatible resin bags. The filtration process yields clean deionized water, which is sent through hollow extension poles to high windows, limiting the need for ladders. The deionized water attracts dirt and grime, allowing users to clean in a single step without any chemicals. No squeegeeing or drying steps are required.

Window washer kits include water filtration units, hollow extension poles of varying lengths, and flow-through scrubbing heads.

Pure water window washer machines provide deionized water for pure water cleaning systems. They completely filter all dissolved solids from tap water and are the primary system component. Deionized water requires no detergents or chemicals to clean windows, which dry completely on their own, eliminating the need for squeegeeing.

Resin replace filter media for Unger Pure Water window washer machines.
