## Power-On-Demand Vacuum

### ■ Dry pickup

Connects to a power tool for dust extraction and shuts off automatically when the tool shuts off. It has an outlet on the operating panel for plugging in

power tools, so that the vacuum will run only when the power tool runs. It's used for collecting dust from cutting, sanding, drilling, and grinding tools. Vacuum also functions as wet/dry vacuums for cleaning dust and dirt or liquid spills.

GUARDAIR

## Pneumatic Personnel Cleaning Stations

### ■ Wet/Dry pickup

Vacuum dust, powders, and chips from workers' clothing and skin. Stations provide an alternative to dusting off with air guns, which generate potentially dangerous pressures that could cause eye or ear injuries. Powered by compressed air and have a brush attachment to loosen particles so they can be suctioned into the attached tank. Nonelectrical discharge (NED) protection suppresses static-charge buildup to allow use with combustible materials such as metal or coal dust, flour, grain, and sugar.

## Slurry Vacuums

### ■ Wet pickup

Suction up the mix of water and dust generated by concrete cutting, drilling, grinding, and sawing. They handle slurries, which are typically too heavy for standard wet/dry vacuums. Slurry vacuums help prevent hazardous dust from becoming airborne and keep slurry from clogging drains and entering sewage systems.

## Built-In-Pump Vacuums

### ■ Wet pickup

Combine a wet/dry vacuum for cleaning up dust, dirt, or liquid spills and a pump for transferring large volumes of water. They can suction debris or liquids into the tank like a standard shop vacuum or can connect to a garden hose to pump water through the hose as it's suctioned into the vacuum. This pumping feature eliminates the need to empty the tank when clearing water from flooded basements or broken pipes. **10W854** operates in three modes: vacuum only, pump only, or vacuum and pump. **39C364** quickly removes water from flooded structures.
