## Noise Reduction Rating (NRR)

Noise Reduction Rating (NRR) is the maximum number of decibels (dB) that a properly fitted hearing protector will reduce noise levels. When choosing the right hearing protection for your application, OSHA suggests subtracting 7 from the NRR value, to help account for improper fit.

Level (dB)	Example of Noise Levels
140	Rifle Fired 1 Meter Away
120	Basketball Game Crowd Noise
100	Chainsaw
90	Drilling Concrete, Leaf Blower
80	Vacuum Cleaner
50	Floor Fan

## Insertion Method

**Roll-Down**—Roll-down earplugs must be rolled and compressed by hand before being inserted into the ear canal. Once inserted, the earplug expands to create a seal.

**Push-In**—As implied by the name, push-in earplugs are inserted into the ear canal with a gentle push. They do not need to be rolled and compressed before insertion.

## Bell-Shaped Ear Plugs

## ■ Disposable

A flared end provides extra coverage outside the ear canal, and also provides a gripping point to aid insertion and removal of the plug. No-Touch plugs have an integral stem to help keep foam tips clean.

					Uncorded		Corded

## Bullet-Shaped Ear Plugs

## ■ Disposable

Plugs have straight sides that gradually taper toward the rounded tip for a comfortable fit in the ear canal. Also called tapered ear plugs.
