Alarm Systems

Alarm systems alert safety personnel when an eyewash station or shower has been activated, allowing for a quicker response to emergencies. They deter tampering and false activation. Alarms detect when water begins to flow and set off horns and flashing lights that call attention to the area of the emergency.

Recessed alarm systems have a low profile to take up less space in hallways and other narrow spaces.

Hazardous location equipment is installed where flammable vapor, combustible dust, or ignitable flyings are present. It keeps arcs and sparks contained so explosive substances present in the air won't have a source of ignition. Class I/Division 2 hazardous location rating.

Alarm flow switches trigger alarms when water flow is detected.

Accessories & Testing Supplies

Shower curtains install on safety showers to provide privacy, protect workers from elements, and reduce water spray. **Adapters** connect eyewash units to existing plumbing. **Bleed valves** sense water temperature and open to allow water to flow through to maintain a safe working temperature. **Flow gauges** measure spray patterns and arc to ensure eyewash stations are operating within the standards defined by ANSI/ISEA Z358.1. **Testing kits** include supplies needed to perform weekly tests of emergency eyewash stations and safety showers. **Funnels** work with other supplies for testing safety showers and safety showers with an integrated eyewash station.
