Pump Control Pa	nels

# Models are wall-mounted boxes with relays, switches,

and breakers for controlling the start and stop cycling of sump and sewage pumps and attached alarms. These pump control panels use wiring to connect to the pump and allow for automatic or manual pump operation depending on the application.

## 6WY64 5VD15 Air Inlet Max. Diameter Pressure Head Solids

## SANDPIPER ARO

#### **Pneumatic Utility and Dewatering Pumps**

These self-priming and run-dry capable pumps operate at low speeds to handle mud, leaves, twigs, sand, sludge, trash-laden water, and soft solids without clogging or choking. They are powered by an air compressor and don't have an electric motor that produces sparks that may ignite flammable liquids. Pumps transfer moderate amounts of water on jobsites and accept an inlet hose so they don't have

to be placed in the water that needs to be drained. They are self-draining to prevent damage in belowfreezing weather and have a continuous automatic lubricating internal oiler and an oil-batch-lubricated shaft seal. 5VD16 and 5VD15 have a screened inlet and an adjustable impeller and impeller cover to help maintain peak performance. All models have a castiron, 2-vane trash-type impeller. CE Certified.

### Sump/Sewage Check Valves

Prevent backflow of sump disposal lines, wastewater lines, sewage lift stations, and ejector systems. They are used in combination with piston, diaphragm and metering pumps and commonly use ball check valves that combine balls and seats in the same valve body for a leak-free shutoff. For additional

sizes, go to Grainger.com and search for "sewage check valves."

Klunkless 1XHV8—A large "silencing air chamber" absorbs the clunking sound when the sump pump turns off.
