

Cable Drill Bits for Wire Systems

Bits can bend around obstructions when drilling holes for running wire and cable in hard-to-reach areas. Wire-fishing holes allow wires to be pulled through surfaces after drilling. All bits, except Interchangeable Head and Shank bits, have a tip that prevents it from moving or walking during drilling.

Auger-Style—Wide flutes evacuate chips more efficiently than other styles of cable drill bits.

Interchangeable Head and Shank—Allows users to exchange the bits' head with a compatible head of a different style or replace the bits' shank with a shank of a different length.

Screw-Point—The tips have sharper threads and provide more pulling power than other styles of cable drill bits.

Serrated-Head—The serrated head helps pull the bits through walls and other surfaces.

Drill Bits for Glass, Tile, and Stone

These bits are designed to avoid damaging the bits or the workpiece when drilling holes in glass, ceramic, tile, natural stone, and porcelain.

Arrow-Tip Drill Bits for Glass and Tile—Have a tip that helps stop them from moving or walking when starting a hole, and allows bits to drill holes that are smaller than their bit diameter. Create holes in tile, porcelain, ceramic, and mirror glass and are typically used for creating smaller holes than would be possible with diamond-tipped core bits for tile.

Diamond-Tip Core Bits for Tile—Bits have hollow centers surrounded by cutting edges that have been coated with diamond abrasives to allow the bits to grind through porcelain, tile, and other very hard materials. They cut through the perimeter of the hole during drilling and leave a solid slug of material that can be ejected through a side slot on the bits. Typically used for drilling larger holes than would be possible with arrow-tip drill bits for glass and tile.

Drill Bits for Natural Stone—Feature multiple cutting edges that allow them to create holes in natural stone tile, slate, granite, and other hard specialty tiles more quickly than standard drill bits for glass and tile. Bits have tips that help prevent them from moving or walking when starting to drill.

Drill Bit Kits for Porcelain Tile—Kits each have a drill bit for creating holes in porcelain tile with a scratch hardness of eight or less. They also come with a pilot bit for creating a starter hole prior to drilling which helps prevent the drill bit from moving or walking when starting to drill. Bits have spiral flutes that pull dust and chips out of the hole during drilling.
