

## **General-Purpose Diagonal-Cutting Pliers**

These pliers feature blade-like cutting edges that are offset from the handles to cut closely against surfaces. They concentrate leverage in their short jaws to maximize cutting force. ESD-Safe pliers can dissipate electrostatic charges to protect static-sensitive electrical components from damage. Insulated tools have non-conductive handle grips to protect against electrical shock. Non-Sparking pliers resist creating sparks and reduce the risk of ignition when working in areas where combustible dust or flammable liquids, gas, or vapors are present.

**Flush**—Feature extra sharp blades that leave a flat, smooth edge on materials. Pliers can make the finest cuts but tend to dull more quickly than standard- or semiflush-cut pliers. They are commonly used to prepare materials for soldering.

**Semiflush**—Tools leave a slightly pointed, pinched edge on materials. Pliers can make cleaner cuts but tend to dull more quickly than standard-cut pliers. They are commonly used for electronics assembly.

**Standard**—Pliers leave a pointed, pinched edge on materials. They make rougher cuts but typically stay sharper to make more cuts than flush- or semiflush-cut pliers.
